
Input to Memory Agent
Task description + recent trajectory (last N steps) + current memory bank
Phase 1: Bank Management
Uses tool calls to update memory
system = PHASE1_SYSTEM
tools = save_knowledge, save_procedural, update_status, delete
Tool calls are executed
Status
current task-solving progress
Knowledge
what we know about the environment
Procedural
successful / failed experience
Memory Bank
Status
current task-solving progress
Knowledge
what we know about the environment
Procedural
successful / failed experience
updated memory bank
Phase 2: Context Decision
No tools, only decides whether to intervene
system = PHASE2_SYSTEM
tools = none
sees = updated memory bank
<context_for_action>
specific, actionable note for the Action Agent
OR
<no_intervention/>
stay silent
If context_for_action:
wrap as <memory_context> and inject into Action Agent
If no_intervention:
no injection
Action Agent
Acts every step
memory_context
